Rx

Patient: **John Doe** Age: 34 Visit Date: 16-Jan-2026 Dx: Focal Impaired Awareness, Secondary Generalized Tonic-Clonic

Seen today for routine epilepsy follow-up. Since last visit, patient reports approximately 4 seizure episodes overall, average duration 9.0 mins, with seizure clustering: Yes. Patient notes rising epigastric sensation as the most consistent aura.

On current regimen (Levetiracetam (Keppra) 1000mg BID, Lamotrigine 150mg BID), patient reports occasional dizziness, more noticeable in the morning dose. Regarding sleep, reports occasional difficulty initiating sleep, otherwise stable. Cognitively, concentration and memory appear stable on informal review.

Overall clinical impression: seizure control reasonably stable, quality-of-life trending favorably. Plan: Maintain current dosing; encourage consistent sleep schedule and trigger avoidance.
